ABSTRACT

This booklet presents data on years of schooling completed by individuals who are 15 years old and older. Data are presented in tabular and narrative form. Characteristics considered in the survey include age, sex, race, Spanish origin, type of residence, region of residence, occupations, marital status, and education of spouse. Findings indicate that 70 percent of persons 25 years old and older were high school graduates in March of 1980 and the proportion who completed 4 or more years of college rose from 6 to 17 percent from 1950 to 1981. Although the proportion of men who completed 4 years of college grew more than that for women, the closeness of the 1981 figures show a recent trend toward convergence of attainment levels for men and women. The number of persons who completed high school and attended colleges increased proportionately more for blacks than whites--although white youths were still more likely than black youths to be high school graduates. Whereas the proportion of persons who were high school graduates was substantially greater for younger (25-34 year olds) than older (45-50 year olds) in the Northwest, Midwest, and South, the advantage the West seemed to have had in educational attainment appears to be disappearing as younger cohorts in other regions have been catching up. The bulk of the report contains tables of statistics that document these and other trends, definitions and explanations, and sources and reliability of the estimates. (LH)

Educational Attainment in the United States: March 1981 and 1980

In March 1981 about 70 percent of all adults 25 years old and over were high school graduates. Ten years earlier the figure was 56 percent, and in 1950, only 34 percent were high school graduates. The change reflected the rapidly increasing high school graduation rate of young people (table 12), mortality among the older, less well-educated population and the larger relative size of the younger cohorts. Of young adults 25 to 29 years old, 86 percent were high school graduates in 1981, and only 53 percent were high school graduates in 1950. The proportion of adults who had completed 4 or more years of college also grew, as college completion rates of young adults increased. In the three decades from 1950 to 1981, the percentage of all adults 25 years old and over who had completed college rose from 6 percent to 17 percent. Among young adults (25 to 29 years old), college completion rose from 8 to 21 percent in the same period.

This report contains data from supplements to the Current Population Survey (CPS) conducted by the Bureau of the Census in March 1981 and 1980 and earlier years. The detailed tables present data on years of school completed by persons 15 years old and over by age, sex, race, Spanish origin, type of residence, region of residence, occupation, marital status, and education of spouse. Survey data for 1981 were inflated to independent population estimates based on the 1980 census. Survey data for 1980 were inflated separately to independent estimates based on the 1980 census and on the 1970 census. Therefore, two sets of data are shown for 1980, with the census on which each is based always noted. The 1970 census-based estimates are included in order to show consistent time series with data for earlier years.

RECENT TRENDS FOR MEN AND WOMEN

Thirty and forty years ago men and women differed very little in the proportion who were college graduates because so few of each group completed college. 5.5 percent and 3.8 percent, respectively, in 1940 and 7.3 percent and 5.2 percent, respectively, in 1950 (table 12). During the next three decades, the proportions of adults with college educations increased rapidly. However, the proportion of men who completed 4 years of college grew more than that for women, so that by 1981, 21 percent of men and 13 percent of women 25 years and over were college graduates. These summary figures for all adults 25 years old and over obscure recent changes in college attendance and completion patterns, which are evident in the achievements of the youngest age group. Among persons 25 to 29 years old, 23 percent of the men and 20 percent of the women were graduates in 1981, up from 20 percent and 13 percent, respectively, in 1970. The closeness of the 1981 figures shows the recent convergence of attainment levels for men and women.

Changes in attainment patterns occurred at different times for men and women. Prior to World War II, a college degree was a rare commodity, but men were somewhat more likely than women to be graduates (table 12). For a short time during World War II, there were more women than men enrolled in college,[1] but this did not change the relative position of men and women as college graduates. After World War II, the GI Bill allowed a large number of men to pursue college careers at reduced cost, and few women were eligible for GI Bill benefits. The stimulus provided by the Russian launching of Sputnik in 1957 caused new interest in college enrollment and subsequent college completion.

Although the proportion of women who were college graduates grew, it did not keep up with the growth for men. In 1940, 7 percent of young adult men (25 to 29 years old) were college graduates, compared with 5 percent of young adult women. By 1959, about twice the proportion of young adult men as women were college graduates (15 percent versus 8 percent). The beginning of the Vietnam Era influenced new growth in enrollment for men in the mid-1960's and enrollment stayed high into the early 1970's.[2] The enrollment of women accelerated in the 1960's and 1970's, and the proportion who had completed college grew by half from 1970 to 1981, from 13 percent to 20 percent. During the same period, the proportion for men changed by one-sixth from 20 percent to 23 percent. For 25- to 29-year-old women, the proportion who were college graduates has been around 20 percent since 1976.

For men, completion rates appeared to decline in the late 1970's. While a commonly offered explanation is the reported decline in the economic attractiveness of a college education—that there is a glut of college graduates, that a college diploma is no longer a ticket to a professional job, and that new college graduates have not been recruited as en-

thusiastically by private industry as in the past[3]—the decline may be a return to "normal" levels.

The very high enrollment rates shown for young men from 1967 to 1972 and the subsequent rapid decline in rates reported in the 1970's were somewhat overstated but led to speculation about the cause and effect of the observed decline. The statistics presented for those years may be misleading because enrollment rates presented in Current Population Reports are based on the civilian population, and during the Vietnam Era a large proportion of young men were in the Armed Forces. Induction into the Armed Forces and college enrollment are most common at the same ages, and fluctuations in the proportion of an age group in the Armed Forces can affect the reported college enrollment rate with little change in the numbers of students. When the population base changed because of a rapid decrease in the size of the Armed Forces in the early 1970's, there was a rapid reduction in the reported enrollment rate of young men.[4]

However, there was a real increase in enrollment rates among young men in the 1960's and a slight decrease in the 1970's in addition to the "artificial" changes discussed above, as enrollment rates based on the total population rather than civilian population show. College attendance to maintain a draft deferment most likely caused increased college enrollment rates among young men in the 1960's, and the elimination of the draft in the early 1970's probably had some negative impact on enrollment rates in the succeeding years. The enrollment rate for all men 18 to 24 years old (including those in the Armed Forces) rose from 20 percent to 29 percent between 1960 and 1969, then dropped to 25 percent in the mid 1970's. (For civilians the figures were 24, 36, and 27 percent, respectively.) In addition, veterans with GI Bill benefits attended college in the mid-1970's, but as these benefits expired, attendance declined; evidence of this is the rapid increase and decrease in enrollment of men 25 to 34 years old in the 1970's.[5] The result appears to have been that men eligible for the draft during the Vietnam Era received more education than they would have under normal circumstances. On the one hand, some men had additional incentive to remain in school to maintain their draft deferments, while on the other hand, some received additional years of education because of the GI Bill. The group of men who were probably most affected by the experience as reflected in their higher college graduation rates were about 29 to 36 years old in 1981 (table 2). In the following paragraphs, a 5-year cohort of this group (30- to 34-year-olds in 1981) is compared with older and younger cohorts.

College enrollment rates for young men fell slightly in the mid-1970's. Consequently, the proportion of men who were college graduates was not as great for men reaching college age after the Vietnam Era as for the immediately older group. The proportion of college graduates among 25- to 29-year-olds was highest in the latter half of the 1970's (table 12). A comparison of the educational attainment of 5-year birth cohorts at the same age, but measured at different times, gives some indication of differences. Figure 1 shows the proportion who completed at least 1 year of college and 4 or more years of college for each of four birth cohorts at age 25 to 29. The higher rate of college attendance by young men during the late 1960's and early 1970's led to the higher attainment levels achieved by the cohort of men born from 1947 to 1951 (19 to 23 years old in 1970). Figure 1 compares this cohort's achievement with that of earlier and later cohorts. By age 25 to 29, a higher proportion of the 1947-51 cohort had attended and completed college than that of the preceding and succeeding cohorts. In 1976, when they were 25 to 29 years old, 50 percent of the 1947-51 cohort had completed at least 1 year of college and 28 percent were college graduates. The next older cohort, born in 1942-46 and who were 25 to 29 years old in 1971, recorded 38 percent as having completed at least 1 year of college and 20 percent college graduates. The proportions were slightly higher for this cohort than for the one immediately preceding it, but the differences were not as large as those between the 1942-46 cohort and the succeeding one. Of the youngest cohort shown, born in 1952-56, 46 percent had completed 1 or more years of college and 23 percent were college graduates by 1981 when the cohort was 25 to 29 years old. Clearly the 1947-51 cohort had attained higher educational achievement than its adjacent cohorts. By 1981, the proportions who attended and completed college in the earlier cohorts had not caught up with the 1947-51 cohort. Even at older ages there is some evidence (at the 90 percent level of confidence) that the immediately preceding cohort had not caught up with its successor.

Although it is possible that men of the 1952-56 cohort will attend college at higher rates and older ages and eventually graduate in the same proportion as the 1947-51 cohort, there is presently no evidence that the younger cohort will match the 1947-51 cohort; in fact, the most recent enrollment statistics do not give any indication of an increase in enrollment for older men (25 years old and over).[6] Therefore, all evidence suggests that men in the 1947-51 cohort will maintain higher attainment levels than both younger and older

(College Placement Council survey).

[4]Most of the decline can be explained by the change in the civilian population base. In 1968, 30 percent of 20- and 21-year-old males were in the Armed Forces; in 1976, 9 percent were in the Armed Forces. In that period the civilian enrollment rate for men 20 and 21 years old dropped from 44 to 32 percent. Based on the total population, it dropped from 30 to 29 percent (not a statistically significant decline). FIGURE 1.

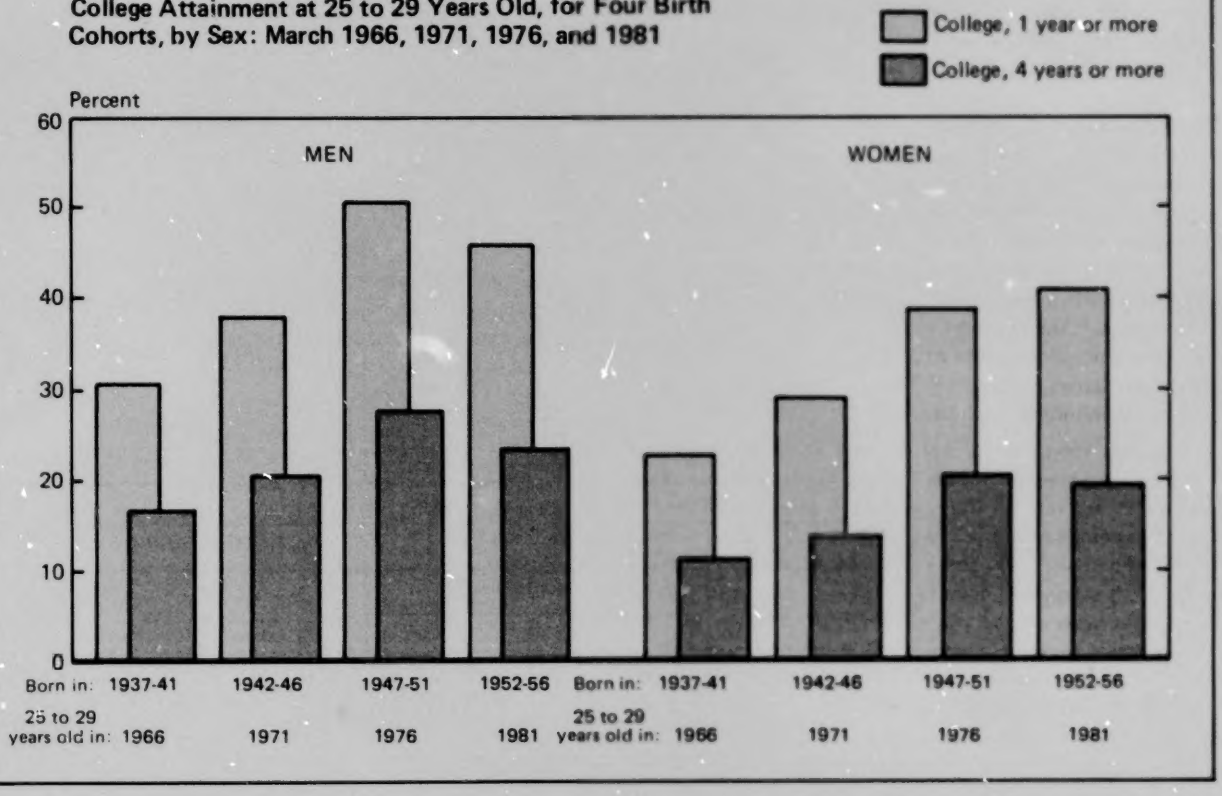
College Attainment at 25 to 29 Years Old, for Four Birth Cohorts, by Sex: March 1966, 1971, 1976, and 1981



men.[7] In addition to this cohort being affected by the events of the Vietnam Era, they also represented the beginning of the baby boom. Their parents were more affluent than the parents of earlier cohorts and perhaps could better afford college educations. At the same time, they were part of a group so much larger than that preceding them and were subject to increased competition in school, which may have resulted in higher aspirations. Theories abound on this generation.[8]

In contrast to the pattern for men, women showed a nearly continuous pattern of increase in the proportion who completed college. The proportions of each cohort who attained the levels displayed in figure 1 and table A have remained more modest than for men, however. Between the first three cohorts shown, there were significant differences in the proportions attaining the college levels shown. The proportion of the 1952-56 cohort who completed 4 or more years of college was not significantly different from its immediate predecessor, the 1947-51 cohort. There is evidence in figure 1 that there was an acceleration in growth in college attainment in the 1970's: the differences between the 1947-51 and 1942-46 cohorts were greater than the differences between the 1942-46 cohort and its predecessor.

REGIONAL DIFFERENCES IN ATTAINMENT

Regional differences in educational attainment levels of the adult population have persisted over time; no doubt one could find even larger differences between smaller areas such as States or cities than those between major geographic regions. This educational diversity reflects present and past regional differences in educational systems and the attainment levels of natives who remained in the region as well as inmigrants and outmigrants. Populations may migrate out of areas of limited opportunities and into areas of greater potential, with higher per capita incomes and industries requiring a work force of particular education levels.[9] Many high technology industries of the West have required a relatively highly skill-

[7]Note that there is no absolute beginning and end to the group of men who are more highly educated, but there is a gradual increase and decrease by age in the proportions who are college graduates, and the cohort most affected by the Vietnam Era enrollments may be 28 to 37 in 1981 rather than 30 to 34 years old. Five-year age groups were used for ease of comparison and discussion. If the larger group had been used, the differences from other groups would have been even larger.

ed work force, and even among the older population of the West (45 to 54 years old in figure 2 and table B), both Whites and Blacks (table 8), the proportions who were high school and college graduates have been higher than for the remainder of the country.

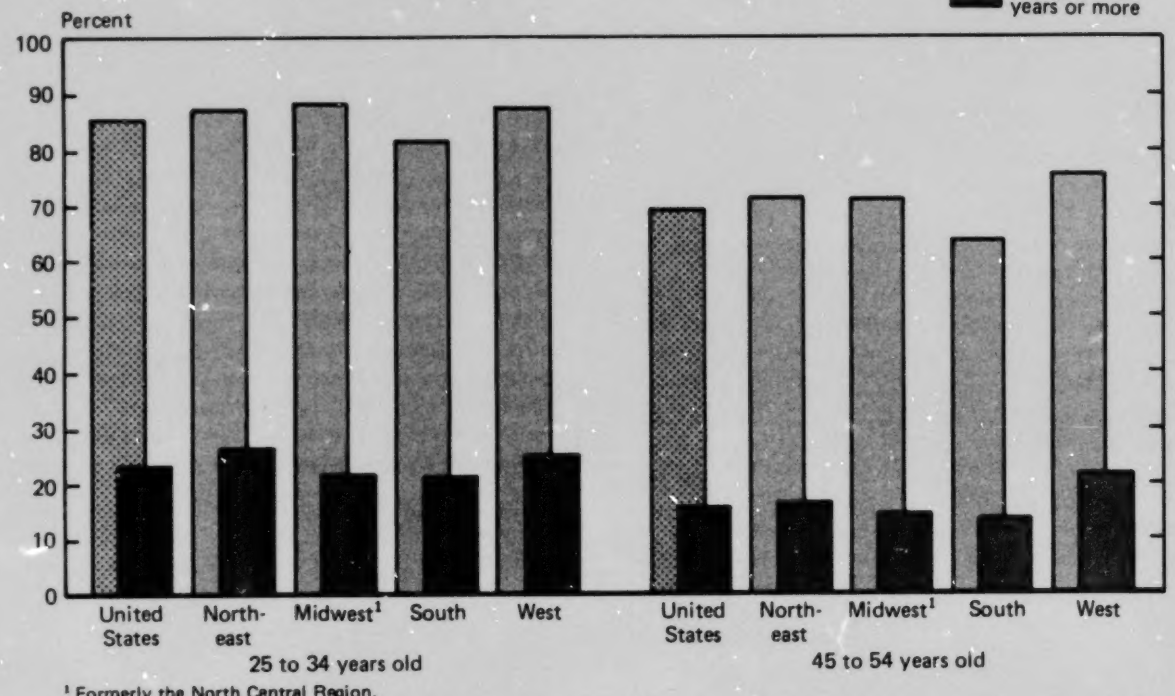
In the South, educational attainment of the adult population 25 years old and over was significantly below the remainder of the country with 64 percent high school graduates in 1981. The West was significantly above with 77 percent (table B). For both Whites and Blacks, the proportions who were high school graduates were highest in the West and lowest in the South (table B). In all regions the likelihood of graduating from high school has increased since 1940, the first census in which such data were collected.

Regional differences show some evidence of change in recent decades. Although less precise than comparing different cohorts at the same ages in that it overlooks the effect of selective migration, selective mortality, and the possibility of schooling at older ages, comparison of two age groups in cross-sectional data can usefully demonstrate changes over time. In all regions in 1981, the proportion of 25- to 34-year-olds who had completed high school was greater than the proportion of persons 45 to 54 years old who had completed the same level (table B); the proportions who had completed college was also greater for the younger than older group. The differences between older and younger persons show intergenerational gains of 11 to 18 percentage points for high school graduates and 4 to 10 percentage points for college graduates so that each region exhibited some improvement between generations in educational achievement.

For both educational levels shown in table B, the interregional differences were greater, in general, for persons 45 to 54 years old than for those 25 to 34 years old. Although the proportion of persons who were high school graduates was greater in the West than in other regions, the differential was more a characteristic of the older than younger populations. The proportion of young persons who had attained that level was not different from the corresponding pro-

FIGURE 2.

Percent High School Graduates and College Graduates, for Persons 25 to 34 and 45 to 54 Years Old, by Region: March 1981



[1] Formerly the North Central Region.

portions in the Northeast and Midwest[10] Regions (around 87 percent), and it was only slightly higher than the proportion for the South (82 percent). For older persons, 45 to 54, however, those in the West were significantly more likely than those in all other regions to have completed high school. In addition, for older persons in the West, the proportion who were college graduates was higher than for all other regions. For the youngest age group, this was not true (table B). In fact, the proportion of young adults who were college graduates was highest in the Northeast and the West.

[10]Formerly the North Central Region.

Table B. Percent High School Graduates and College Graduates, by Age and Region: March 1981

Age	High school, 4 years or more				
	United States	Northeast	Midwest[1]	South	West

Whereas the proportion of persons who were high school graduates and college graduates was substantially greater for the younger than the older group in the Northeast, Midwest and South, the differences in the West were not as great. The advantage the West seemed to have in educational achievement appears to be disappearing as younger cohorts in other regions have been "catching up."

BLACK-WHITE DIFFERENCES

Changes over time in the educational attainment of the White and Black populations are shown in the cross-sectional data in figure 3 which show the proportion of persons of each age who were high school graduates and who had attended college. As described earlier, the proportion of all adults who were high school graduates has increased rapidly in the past 30 years, but even among persons 65 to 69 years old, the majority of White persons were high school graduates by 1981. Only among persons 70 years old and over (table 2) was the proportion who were high school graduates below one-half. For Blacks, however, the proportion who were high school graduates by 1981 fell below one-half for persons in their late forties.

The proportion of the adult population 25 years old and over who are high school graduates is a widely used summary measure of educational attainment. However, changes in this measure depend mostly on differences in the proportion who completed high school among the component age groups; most importantly, the entering population (the youngest group) and the leaving population (the oldest group) as well as the relative sizes of the various age groups rather than on recent changes in high school graduation rates. Since the oldest groups typically have much lower than average proportions who are high school graduates, and the youngest much higher proportions, the overall proportion of adults who are high school graduates has been increasing rapidly. For example, among Whites 25 and over, the percent who were high school graduates rose from 59 to 72 percent from 1971 to 1981 (table 12), but in the youngest age group (25 to 29 years old), the proportions were higher and increased less: about 80 percent in 1971 and 88 percent in 1981. For Blacks in the same period, the proportion who were high school graduates among all adults rose from 35 to 53 percent, while the proportions for the youngest group of (25- to 29-year-olds) were higher but about the same number of percentage points apart: 58 percent in 1971 and 77 percent in 1981.

Attainment levels (in terms of proportions of persons who completed high school and attended college) have increased proportionately more for Blacks than for Whites in the past

40 years, as can be observed comparing two 5-year birth cohorts, about 40 years apart. For Blacks, the proportion who were high school graduates was 24 percent for persons 65 to 69 years old, compared with 77 percent for persons 25 to 29 years old; among Whites the proportions were 53 percent and 87 percent, respectively. The attainment differences between age groups were greater for Blacks than Whites, and the differences between racial groups were greater for the older than the younger groups. Therefore, Blacks experienced a greater rate of increase in high school graduation than Whites and the difference between the races has decreased.

The substantial rise in the proportion of Blacks who were high school graduates, from one-fourth to approximately three-fourths, increased the share of the Black population eligible for higher education, and concurrently, the proportion who completed 1 or more years of college increased. For Blacks, the proportion who completed 1 or more years of college was four times higher for the younger group than the older group: 8 percent among persons 65 to 69 years old and 33 percent for those 25 to 29 years old (table 1). For Whites, the proportion who completed 1 or more years of college little more than doubled: 20 and 44 percent for the older and younger age groups, respectively.

Much of the growth in college attendance can be attributed to the increase in the eligible population (high school graduates). While for the total Black population, the proportion who attended college (completed 1 year or more) quadrupled from the older to the younger group, the proportion of Black high school graduates who attended increased by only one-third (from 32 to 43 percent) which is not significantly different from the change for White high school graduates (37 to 51 percent).[11]

[11]The difference between proportions of White and Black 65- to 69-year-old high school graduates who attended college is not statistically significant.

Appendix A. Definitions and Explanations

Population coverage. The figures in this report for March 1981 and March 1980 are sample survey data and relate to the noninstitutional population of the 50 States and the District of Columbia. Members of the Armed Forces living off post or with their families on post are included; all other members of the Armed Forces are excluded. The March 1981 survey included 817,000 members of the Armed Forces and the March 1980 survey includes 855,000 members of the Armed Forces in the United States.

Population figures shown for States and SMSA's are based on weighted results of the Current Population Survey and have not been adjusted to independent Census Bureau estimates.

Introduction of 1980 census population controls. The estimation procedure used for this survey involves the inflation of the weighted sample results to independent estimates of the civilian noninstitutional population of the United States by age, race, and sex. These independent estimates are based on civilian noninstitutional population counts from the decennial censuses and are updated with statistics on births, deaths, immigration, and emigration and statistics on the strength of the Armed Forces. Data published in this series for 1972 through 1979 were based on independent population estimates derived by updating the 1970 decennial census counts. Starting with the data collected in March 1980 Current Population Survey (CPS), independent estimates were based on civilian noninstitutional population controls for age, race, and sex established by the 1980 decennial census. In table 1 of this report, two sets of data are shown for 1980, using both 1980 census based population estimates and 1970 census based population estimates. The 1970 based estimates have been included to provide continuity with previous years.

The April 1980 census population count differed somewhat from the independent estimates for April 1980 derived by updating 1970 census population figures. The April 1980 census count of the civilian noninstitutional population was 222,420,441, compared with the 1970 census based figure of 217,400,244 used for the CPS. Basically, this difference had little impact on summary or proportional measures, such as medians and percent distributions; however, use of the new controls could have significant effect on the absolute numbers. The effects can be seen in table 1 where estimates for 1980 are shown using both 1970 and 1980 census based estimates.

Age. The age classification is based on the age of the person at his last birthday.

Race. The population is divided into three groups on the basis of race: White, Black, and "other races." The last category includes Indians, Japanese, Chinese, and any other race except White and Black. In this report, "other races" is not shown separately.

Spanish origin. Information on origin or descent was obtained by asking "What is (this person's) origin or descent?" Responses generally refer to a person's perceived national or ethnic lineage and do not necessarily indicate the country of birth of himself or his parents.

Persons of Spanish origin are persons who reported themselves as Mexican American, Chicano, Mexican, Mexicano, Puerto Rican, Cuban, Central or South American, or other Spanish origin. However, all persons who reported themselves as Mexican American, Chicano, Mexican, or Mexicano were combined into the one category: Mexican. Persons of Spanish origin may be of any race.

Years of school completed. Data on years of school completed in this report were derived from the combination of answers to two questions: (a) "What is the highest grade of school he has ever attended?" and (b) "Did he finish this grade?"

The questions on educational attainment apply only to progress in "regular" schools. Such schools include graded public, private, and parochial elementary and high schools (both junior and senior high), colleges, universities, and professional schools, whether day schools or night schools. Thus, regular schooling is that which may advance a person toward an elementary school certificate or high school diploma, or a college, university, or professional school degree. Schooling in other than regular schools was counted only if the credits obtained were regarded as transferable to a school in the regular school system.

The median years of school completed is defined as the value which divides the population into two equal parts—one half having completed more schooling and one-half having completed less schooling than the median. This median was computed after the statistics on years of school completed had been coverted to a continuous series of numbers (e.g., completion of the first year of high school was treated as completion of the 9th year and the completion of the first year of college as completion of the 13th year). The persons completing a given school year were assumed to be distributed evenly within the interval from .0 to .9 of the year (for example, persons completing the 12th year were assumed to be distributed evenly between 12.0 and 12.9). In fact, at the time of the March survey, most of the enrolled persons had completed about three-fourths of a school year

beyond the highest grade completed, whereas a large majority of persons who were not enrolled had not attended any part of a grade beyond the highest one completed. The effect of the assumption is to place the median for younger persons slightly below, and for older persons' slightly above, the true median. Because of the inexact assumption as to the distribution within an interval, this median is more appropriately used for comparing groups and the same group at different dates than as an absolute measure of educational attainment.

Metropolitan-nonmetropolitan residence. The population residing in standard metropolitan statistical areas (SMSA's) constitutes the metropolitan population. Except in New England, an SMSA is a county or group of contiguous counties which contains at least one city of 50,000 inhabitants or more, or "twin cities" with a combined population of at least 50,000. In addition to the county or counties containing such a city or cities, contiguous counties are included in an SMSA if, according to certain criteria, they are essentially metropolitan in character and are socially and economically integrated with the central county. In New England, SMSA's consist of towns and cities rather than counties. The metropolitan population in this report is based on SMSA's as defined in the 1970 census and does not include any subsequent additions or changes.

The population inside SMSA's is further classified as "in central cities" and "outside central cities." With a few exceptions, central cities are determined according to the following criteria:

1. The largest city in an SMSA is always a central city.
2. One or two additional cities may be secondary central cities on the basis and in the order of the following criteria:
   a. The additional city or cities has at least 250,000 inhabitants.
   b. The additional city or cities has a population of one-third or more of that of the largest city and a minimum population of 25,000.

Comparability of metropolitan and nonmetropolitan data from the 1978 CPS with data for previous years. Changes in CPS design and procedures over the last several years have made the annual series of sample population data for metropolitan and nonmetropolitan areas inconsistent. Analytic comparisons of year-to-year changes in these figures should be avoided. Trends in metropolitan and nonmetropolitan population growth over the period from 1970 to 1981 and from 1976 to 1981 should not be appreciably affected by the procedural changes.

The major revisions to the CPS sample design and estimation methods have involved the expansion of the number of sample units from 55,000 housing units to 69,000 housing units. This incorporation of approximately 10,000 supplemental housing units into the March CPS sample in 1977 was accompanied by new procedures for inflating the sample results to reflect national estimates. It was determined subsequent to the introduction of the additional sample the new inflating (weighting) procedures used for processing both the March 1977 and March 1978 CPS supplement data had resulted in an apparent overestimate of the nonmetropolitan population and corresponding underestimate of the metropolitan population for those years. For March 1979, another revision of the weighting process was introduced to correct the problem discovered in the earlier procedures. The result of this change was a large spurious increase in the metropolitan population and decrease in the nonmetropolitan population relative to March 1978 levels.

Other operational changes including the introduction of a coverage improvement sample designed to provide greater accuracy in survey estimation occurred in 1979. The net effect of all changes in procedure was to increase the metropolitan area estimates.

Farm-nonfarm residence. The farm population refers to rural residents living on farms. The method of determining farm-nonfarm residence in the Current Population Surveys since March 1960 is the same as that used in the 1960 census but differs from that used in earlier censuses.

The nonfarm population, as the term is used here, comprises persons living in urban areas and all rural persons not on farms.

According to the current definition, the farm population consists of all persons living in rural territory on places of less than 10 acres yielding agricultural products which sold for $250 or more in the previous year, or on places of 10 acres or more yielding agricultural products which sold for $150 or more in the previous year. Rural persons in institutions, motels, and tourist camps, and those living on rented places where no land is used for farming are not classified as farm population.

Geographic regions. The four major regions of the United States, for which data are presented in this report, represent groups of States, as follows:

Northeast: Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, and Vermont.

Midwest:[1] Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, and Wisconsin.

South: Alabama, Arkansas, Delaware, District of Columbia, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, and West Virginia.

West: Alaska, Arizona, California, Colorado, Hawaii, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, and Wyoming.

The North as used in this report includes the combined Northeast and Midwest Regions.

Employed. Employed persons comprise those civilians who, during the survey week, were either (1) "at work"—those who did any work for pay or profit, or worked without pay for 15 hours or more on a family farm or business; or (2) "with a job but not at work"—those who did not work and were

[1]Formerly the North Central Region.

not looking for work but had a job or business from which they were temporarily absent because of vacation, illness, labor-management dispute, bad weather, or because they were taking the week off for various other reasons.

Occupation. Data on occupation are shown for the employed and relate to the job held during the survey week. Persons employed at two jobs or more were reported in the job at which they worked the greatest number of hours during the week. The major groups used here are generally the major groups used in the 1970 Census of Population. The composition of these groups is shown in 1970 Census of Population, Vol. 1, *Characteristics of the Population, U.S. Summary*.

Four occupation divisions. The major groups are arranged in four divisions as follows:

White collar. Professional, technical, and kindred workers; managers and administrators, except farm; sales workers; and clerical and kindred workers.

Blue collar. Crafts and kindred workers; operatives, except transport; transport equipment operatives; and laborers, except farm.

Farm workers. Farmers and farm managers, farm laborers, and farm supervisors.

Service workers. Service workers including private household.

The sequence in which these four divisions appear is not intended to imply that any division has a higher social or skill level than another.

Symbols. A dash (—) represents zero or rounds to zero, and the symbol "B" means that the base for the derived figure is less than 75,000. An "X" means not applicable, and "NA" means not available.

Rounding of estimates. Individual figures are rounded to the nearest thousand without being adjusted to group totals which are independently rounded. With few exceptions, percentages are based on the rounded absolute numbers.

Appendix B. Source and Reliability of Estimates

SOURCE OF DATA

Most of the estimates in this report are based on data collected in March 1981 and 1980 from the Current Population Survey (CPS) of the Bureau of the Census. Some estimates are based on data obtained from the CPS in earlier years and from the 1960, 1950 and 1940 decennial censuses. The monthly CPS deals mainly with labor force data for the civilian noninstitutional population. Questions relating to labor force participation are asked about each member 14 years old and older in each sample household. In addition, supplementary questions are asked each March about educational attainment. In order to obtain more reliable data for the Spanish-origin population, the March CPS sample was enlarged to include all households from the previous November sample which contained at least one person of Spanish origin. This results in almost doubling the number of sample persons of Spanish origin. For this report, persons in the Armed Forces living off post or with their families on post are included.

The present CPS sample was initially selected from the 1970 census files with coverage in all 50 States and the District of Columbia. The sample is continually updated to reflect new construction. The current CPS sample is located in 629 areas comprising 1,148 counties, independent cities, and minor civil divisions in the Nation. In this sample, approximately 68,500 occupied households were eligible for interview. Of this number, about 3,000 occupied units were visited but interviews were not obtained because the occupants were not found at home after repeated calls or were unavailable for some other reason.

The following table provides a description of some aspects of the CPS sample designs in use during the referenced data collection periods.

Description of the March Current Population Survey

Time period	Number of sample areas	Housing units eligible	
		Interviewed	Not interviewed
1980 to 1981.....	629	65,500	3,000
1977 to 1979.....	614	55,000	3,000
1973 to 1976.....	461	46,500	2,500
1972.....	449	45,000	2,000
1967 to 1971.....	449	48,000	2,000
1963 to 1966.....	357	33,500	1,500
1960 to 1962.....	333	33,500	1,500
1957 to 1959.....	330	33,500	1,500
1954 to 1956.....	230	21,000	500-1,000
1947 to 1953.....	68	21,000	500-1,000

The estimation procedure used in this survey involved the inflation of the weighted sample results to independent estimates of the total civilian noninstitutional population of the United States by age, race, and sex. These independent estimates were based on statistics from decennial censuses, statistics on births, deaths, immigration and emigration; and statistics on the strength of the Armed Forces. The independent population estimates used in this report to obtain data for 1980 and 1981 are based on the 1980 decennial census. Some of the data in this report for 1980 were also obtained using independent population estimates based on the 1970 decennial census. In earlier reports in this series (P-20), data for 1972 through 1979 were obtained using independent population estimates based on the 1970 decennial census. For more details on this change, see the section in appendix A entitled, "Introduction of 1980 Census Population Controls." The estimation procedure for the data in the report also involved a further adjustment so that husband and wife of a household received the same weight.

RELIABILITY OF ESTIMATES

Since the CPS estimates in this report are based on a sample, they may differ somewhat from the figures that would have been obtained if a complete census had been taken using the same questionnaires, instructions, and enumerators. There are two types of errors possible in an estimate based on a sample survey: sampling and nonsampling. The standard errors provided in this report primarily indicate the magnitude of the sampling error. They also partially measure the effect of some nonsampling errors in response and enumeration, but do not measure any systematic biases in the data. The full extent of nonsampling error is unknown. Consequently, particular care should be exercised in the interpretation of figures based on a relatively small number of cases or on small differences between estimates.

Nonsampling variability. As in any survey work, the results are subject to errors of response and nonreporting in addition to sampling variability. Nonsampling errors can be attributed to many sources, e.g., inability to obtain information about all cases in the sample, definitional difficulties, differences in the interpretation of questions, inability or unwillingness of respondents to provide correct information, inability to recall information, errors made in collection such as in recording or coding data, errors made in processing the data, errors made in estimating values for missing data, and

failure to represent all sample households and all persons within sample households (undercoverage).

Undercoverage in the CPS results from missed housing units and missed persons within sample households. Overall undercoverage as compared with the level of the 1980 decennial census is about 7 percent. It is known that CPS undercoverage varies with age, sex, and race. Generally, undercoverage is larger for males than for females and larger for Blacks and other races combined than for Whites. Ratio estimation to independent age-sex-race population controls, as described previously, partially corrects for the biases due to survey undercoverage. However, biases exist in estimates to the extent that missed persons in missed households or missed persons in interviewed households have different characteristics than interviewed persons in the same age-sex-race group. Further, the independent population controls used have not been adjusted for undercoverage in the decennial census.

Comparability with other data. In using metropolitan and nonmetropolitan data, caution should be used in comparing estimates for 1977 and 1978 to each other or to any other years. Methodological and sample design changes occurred in these years resulting in relatively large differences in the metropolitan and nonmetropolitan area estimates. However, estimates for 1979 and later are comparable as are estimates for 1976 and earlier.

A number of changes were made in data collection and estimation procedures beginning with the March 1980 CPS. One major change was the use of the "householder" concept instead of the traditional "head" concept. The other major change occurred in the estimation procedure. Due to these and other changes caution should also be used when comparing estimates for 1980 and later, which reflect 1980 census-based population controls, to those for 1971 through 1979, which reflect 1970 census-based population controls. This change in population controls had relatively little impact on summary measures such as means and medians, but did have a significant impact on levels. For example, use of 1980-based population controls resulted in about a 2-percent increase in the civilian noninstitutional population and in the number of families and households. Thus, estimates of levels for 1980 and later will differ from those for 1979 and earlier more than what could be attributed to actual changes in the population and these differences could be disproportionately greater for certain subpopulation groups than for the total population.

Decennial Census of Population. The 1940, 1950 and 1960 decennial census data shown in this report are not strictly comparable to the CPS data. This is due in a large part to differences in interviewer training and experience and in different survey processes. This is an additional component of error not reflected in the standard error tables. Therefore, caution should be used in comparing results between these different sources.

Sampling variability. The standard errors given in tables B-1 through B-4 are primarily measures of sampling variability, that is, of the variation that occurred by chance because a sample rather than the entire population was surveyed. The sample estimate and its standard error enable one to construct confidence intervals, ranges that would include the average result of all possible samples with a known probability. For example, if all possible samples were selected, each of these being surveyed under essentially the same general conditions and using the same sample design, and if an estimate and its standard error were calculated from each sample, then:

1. Approximately 68 percent of the intervals from one standard errors below the estimate to one standard error above the estimate would include the average result of all possible samples.
2. Approximately 90 percent of the intervals from 1.6 standard errors below the estimate to 1.6 standard errors above the estimate would include the average result of all possible samples.
3. Approximately 95 percent of the intervals from two standard errors below the estimate to two standard errors above the estimate would include the average result of all possible samples.

The average estimate derived from all possible samples is or is not contained in any particular computed interval. However, for a particular sample, one can say with a specified confidence that the average estimate derived from all possible samples is included in the confidence interval.

Standard errors may also be used to perform hypothesis testing, a procedure for distinguishing between population parameters using sample estimates. The most common types of hypotheses are 1) the population parameters are identical, or 2) they are different. An example of this would be comparing the percent of adults who were high school graduates in 1981 to those in 1971. Tests may be performed at various levels of significance, where a level of significance is the probability of concluding that the parameters are different when, in fact, they are identical. All statements of comparison in the text have passed a hypothesis test at the 0.10 level of significance or better, and most have passed a hypothesis test at the 0.05 level of significance or better. This means that, for most differences cited in the text, the estimated difference between parameters is greater than twice the standard error of the difference. For the other differences mentioned, the estimated difference between parameters is between 1.6 and 2.0 times the standard error of the difference. When this is the case, the statement of comparison will be qualified in some way; e.g., by use of the phrase "some evidence."

Note when using small estimates. Summary measures (such as means, medians, and percent distributions) are shown when the base is 75,000 or greater. Because of the large standard errors involved, there is little chance that summary measures would reveal useful information when computed on a smaller base. Estimated numbers are shown, however, even though the relative standard errors of these numbers are larger than those for the corresponding percentages.

These smaller estimates are provided primarily to permit such combinations of the categories as serve each user's needs.

Standard error tables and their use. In order to derive standard errors that would be applicable to a large number of estimates, a number of approximations were required. Therefore, instead of providing an individual standard error for each estimate, generalized sets of standard errors are provided for various types of characteristics. As a result the sets of standard errors provided give an indication of the order of magnitude of the standard error of an estimate rather than the precise standard error.

Standard errors for data based on the CPS sample. The figures presented in tables B-1 through B-4 are approximations to standard errors of various educational attainment estimates for persons in the United States. Estimated standard errors for specific characteristics cannot be obtained from tables B-1 through B-4 without the use of the factors in table B-5. The factors in table B-5 must be applied to the generalized standard errors in order to adjust for the combined effect of sample design and estimating procedure on the value of the characteristic. Further adjustments must be made to account for State, SMSA and regional variation using factors given in table B-6. Standard errors for intermediate values not shown in the generalized tables of standard errors may be approximated by linear interpolation.

Two parameters (denoted "a" and "b") are used to calculate standard errors for each type of characteristics; they are also presented in table B-5. These parameters were used to calculate the factors in table B-5. They also may be used to directly calculate the standard errors for estimated numbers and percentages. Methods for direct computation are given in the following sections. The standard errors in tables B-1 through B-4 were calculated using the "b" parameters in table B-5; however, the "a" parameters used were revised to reflect the total persons in the age group.

Data based on the 1940, 1950 and 1960 censuses. Sampling errors of all sample data from 1940, 1950 and 1960 decennial censuses in this report are small enough to be disregarded. However, these standard errors may be found in the appropriate volumes.

Standard errors of estimated numbers. The approximate standard error σ_x, of an estimated number can be obtained in two ways. It may be obtained by use of the formula

$$\sigma_x = f_1 \cdot f_2 \cdot \sigma \qquad (1)$$

Table B-1. Generalized Standard Errors for Estimated Numbers of Persons—Total or White

(Numbers in thousands)

Estimated number of persons	Total persons in age group[1]									
	100	250	500	1,000	2,500	5,000	10,000	25,000	50,000	100,000
10	4.3	4.4	4.4	4.5	4.5	4.5	4.5	4.5	4.5	4.5
20	5.7	6.1	6.2	6.3	6.3	6.3	6.3	6.3	6.3	6.3
30	6.5	7.3	7.5	7.7	7.7	7.7	7.8	7.8	7.8	7.8
40	7.0	8.2	8.6	8.8	8.9	8.9	9.0	9.0	9.0	9.0
50	7.1	9.0	9.5	9.8	9.9	10.0	10.0	10.0	10.0	10.0
75	6.1	10.3	11.3	11.8	12.1	12.2	12.2	12.3	12.3	12.3
100	-	11.0	12.7	13.5	13.9	14.0	14.1	14.2	14.2	14.2
200	-	9.0	15.5	18.0	19.3	19.7	19.9	20.0	20.0	20.0
300	-	-	15.5	20.6	23.1	23.8	24.2	24.4	24.5	24.5
400	-	-	12.7	22.0	26.0	27.2	27.8	28.2	28.3	28.3
500	-	-	-	22.4	28.4	30.1	30.9	31.4	31.6	31.7
750	-	-	-	19.4	32.5	35.8	37.4	38.3	38.6	38.7
1,000	-	-	-	-	34.8	40.1	42.6	44.0	44.4	44.7
2,000	-	-	-	-	28.4	49.2	56.8	60.9	62.2	62.8
3,000	-	-	-	-	-	49.2	65.0	72.9	75.4	76.6
4,000	-	-	-	-	-	40.1	69.5	82.3	86.1	87.9
5,000	-	-	-	-	-	-	71.0	89.8	95.2	97.8
7,500	-	-	-	-	-	-	61.5	102.8	113.3	118.2
10,000	-	-	-	-	-	-	-	109.9	126.9	134.6
20,000	-	-	-	-	-	-	-	89.8	155.5	179.5
30,000	-	-	-	-	-	-	-	-	155.5	205.7
40,000	-	-	-	-	-	-	-	-	126.9	219.9
50,000	-	-	-	-	-	-	-	-	-	224.4
75,000	-	-	-	-	-	-	-	-	-	194.3
100,000	-	-	-	-	-	-	-	-	-	-

[1]These values must be multiplied by the appropriate "f" factor in tables B-5 and/or B-6 to obtain the standard error for a specific characteristic.

Note: To estimate the standard errors for the 1956-66 period, multiply these standard errors by 1.23. For years prior to 1956, multiply by 1.5.

Table B-2. Generalized Standard Errors for Estimated Numbers of Persons—Black and Other Races

(Numbers in thousands)

Estimated number of persons	Total persons in age group[1]						
	100	250	500	1,000	2,500	5,000	10,000
10	4.5	4.7	4.7	4.7	4.7	4.8	4.8
20	6.0	6.5	6.6	6.7	6.7	6.7	6.7
30	6.9	7.7	8.0	8.1	8.2	8.2	8.2
40	7.4	8.7	9.1	9.3	9.4	9.5	9.5
50	7.5	9.5	10.1	10.4	10.5	10.6	10.6
75	6.5	10.9	12.0	12.5	12.8	12.9	13.0
100	-	11.7	13.5	14.3	14.7	14.9	15.0
200	-	9.5	16.5	19.0	20.4	20.9	21.1
300	-	-	16.5	21.8	24.5	25.3	25.7
400	-	-	13.5	23.3	27.6	28.9	29.5
500	-	-	-	23.8	30.1	31.9	32.8
750	-	-	-	20.6	34.5	38.0	39.6
1,000	-	-	-	-	36.9	42.6	45.1
2,000	-	-	-	-	30.1	52.1	60.2
3,000	-	-	-	-	-	52.1	69.0
4,000	-	-	-	-	-	42.6	73.7
5,000	-	-	-	-	-	-	75.2
7,500	-	-	-	-	-	-	65.2
10,000	-	-	-	-	-	-	-

[1]These values must be multiplied by the appropriate "f" factor in tables B-5 and/or B-6 to obtain the standard error for a specific characteristic.

Note: To estimate the standard errors for the 1956–66 period, multiply these standard errors by 1.23. For years prior to 1956, multiply by 1.5.

where f_1 is the appropriate factor from table B-5, f_2 is the appropriate factor from table B-6 and σ is the standard error of the estimate obtained by interpolatinn from tables B-1 or B-2. Alternatively, standard errors may be approximated by using formula (2). The use of formula (1) will provide more accurate results when the number of persons in the age group is relatively small.

$$\sigma_x = f_2 \sqrt{ax^2 + bx} \qquad (2)$$

Here x is the size of the estimate and "a" and "b" are the parameters in table B-5 associated with the particular type of characteristic. When an estimate involves two different categories use the "a" and "b" parameters corresponding to the category with the larger "b" parameter.

Standard errors of estimated percentages. The reliability of an estimated percentage, computed using sample data for both numerator and denominator, depends upon both the size of the percentage and the size of the total upon which this percentage is based. Estimated percentages are relatively more reliable than the corresponding estimates of the numerators of the percentages, particularly if the percentages are 50 percent or more. The approximate standard error, $\sigma_{(x,p)}$ of an estimated percentage can be obtained by use of the formula

$$\sigma_{(x,p)} = f_1 \cdot f_2 \cdot \sigma \qquad (3)$$

In this formula, f_1 is the appropriate factor from table B-5, f_2 is the appropriate factor from table B-6 and σ is the standard error of the estimate from table B-3 or B-4. When the numerator and denominator of the percentage are in different categories, use the factor or parameters from table B-5 indicated by the numerator. Alternatively, standard errors may be approximated by using formula (4), from which the standard errors in tables B-3 and B-4 were calculated. Use of this formula will provide more accurate results than use of formula (3).

$$\sigma_{(x,p)} = f_2 \sqrt{\frac{b}{x} \cdot p(100-p)} \qquad (4)$$

Here x is the size of the subclass of persons or families and unrelated individuals which is the base of the percentage, p is the percentage ($0 < p < 100$), and "b" is the parameter in table B-5 associated with the particular type of characteristics in the numerator of the percentage.

Illustration of standard error computations. Table 8 of this report shows that in March 1981 there were 70,390,000 women 25 years and over. At that time, an estimated 28,896,000 had completed 4 years of high school. Using formula (2) and the appropriate "a" and "b" parameters from table B-5, the approximate standard error of this estimate[1] is

$$193{,}000 \doteq \sqrt{-.000025\,(28{,}896{,}000)^2 + 2014\,(28{,}896{,}000)}$$

The 95-percent confidence interval as derived from the data is from 28,510,000 to 29,282,000 (using twice the

[1]Using formula (1), interpolating from table B-1 and applying the appropriate factors from table B-5 and/or B-6 gives a standard error of approximately 175,000 = 1.0 x 1.0 x 175,000.

Table B-3. Generalized Standard Errors of Estimated Percentages—Total or White

Base of percentage (thousands)	Estimated percentage[1]				
	2 or 98	5 or 95	10 or 90	25 or 75	50
100	2.0	3.1	4.3	6.1	7.1
250	1.3	2.0	2.7	3.9	4.5
500	0.9	1.4	1.9	2.7	3.2
1,000	0.6	1.0	1.3	1.9	2.2
2,500	0.4	0.6	0.9	1.2	1.4
5,000	0.3	0.4	0.6	0.9	1.0
10,000	0.2	0.3	0.4	0.6	0.7
25,000	0.1	0.2	0.3	0.4	0.4
50,000	0.1	0.1	0.2	0.3	0.3
100,000	0.1	0.1	0.1	0.2	0.2
150,000	0.1	0.1	0.1	0.2	0.2

[1]These values must be multiplied by the appropriate "f" factor in tables B-5 and/or B-6 to obtain the standard error for a specific characteristic.

NOTE: To estimate the standard errors for the 1956-66 period, multiply these standard errors by 1.23. For years prior to 1956, multiply by 1.5.

standard error). A conclusion that the average estimate of women 25 years old and over having completed 4 years of high school derived from all possible samples and lying between these two values would be correct for roughly 95 percent of all possible samples.

Table 12 of this report shows that in March 1981, an estimated 21.1 percent of the 62,509,000 men 25 years old and over had completed college. Using formula (4) and the appropriate "b" parameter from table B-5, the approximate standard error of this estimate[2] is

$$0.2 \doteq \sqrt{\frac{2014}{62{,}509{,}000} \times 21.1 \times (100 - 21.1)}$$

The 95-percent confidence interval for this estimate is from 20.7 to 21.5

[2]Using formula (3), interpolating and applying the appropriate factors from table B-5 and /or B-6 gives a standard error of approximately 0.2.

Standard error of a difference. For a difference between two sample estimates; the standard error is approximately equal to

$$\sigma_{(x-y)} \doteq \sqrt{\sigma_x^2 + \sigma_y^2} \qquad (5)$$

where σ_x and σ_y are the standard errors of the estimates x and y; the estimates can be numbers, percents, ratios, etc. This formula approximates the standard error quite accurately for the difference between two estimates of the same characteristics in two different areas, or for the difference between two separate and uncorrelated characteristics in the same area. If, however, there is a high positive (negative) correlation between the two characteristics, the formula will overestimate (underestimate) the true standard error.

Illustration of the calculation of the standard error of a difference. Table 12 shows that in March 1981, an estimated 21.1 percent of men 25 years old and over had completed

Table B-4. Generalized Standard Errors of Estimated Percentages—Black and Other Races

Base of percentage (thousands)	Estimated percentage[1]				
	2 or 98	5 or 95	10 or 90	25 or 75	50
75	2.4	3.8	5.2	7.5	8.7
100	2.1	3.3	4.5	6.5	7.5
250	1.3	2.1	2.9	4.1	4.8
500	0.9	1.5	2.0	2.9	3.4
1,000	0.7	1.0	1.4	2.1	2.4
2,500	0.4	0.7	0.9	1.3	1.5
5,000	0.3	0.5	0.6	0.9	1.1
10,000	0.21	0.3	0.5	0.7	0.8
15,000	0.17	0.27	0.4	0.5	0.6
20,000	0.15	0.23	0.3	0.5	0.5

[1]These values must be multiplied by the appropriate "f" factor in tables B-5 and/or B-6 to obtain the standard error for a specific characteristic.

NOTE: To estimate the standard errors for the 1956-66 period, multiply these standard errors by 1.23. For years prior to 1956, multiply by 1.5.

Table B-5. "a" and "b" Parameters and "f" Factors for Calculating Approximate Standard Errors of Estimated Numbers and Percentages

Type of characteristic	Parameter[1]		
	a	b	f_1 factor[4]
Educational attainment of persons 14 and over:			
Total or White	-.000025	2,014	1.0
Black	-.000179	2,265	1.0
Spanish origin (levels)	[2]+.000901	[2]1,101	(X)
Spanish origin (percentages only)	(X)	[3]2,002	1.0
Marital status:			
Total or White	-.000017	3,500	1.3
Black	-.000210	5,020	1.5
Spanish origin	-.000026	4,432	1.5
Household relationship:			
Head, wife, or primary individual:			
Total or White	-.000010	1,389	0.8
Black	-.000087	1,255	0.7
Spanish origin	-.000020	1,422	0.8
Child or other relative in primary family, secondary family member secondary individual, or persons living in group quarters:			
Total or White	-.000017	3,500	1.3
Black	-.000210	5,020	1.5
Spanish origin	-.000026	4,432	1.5

[1]Multiply parameters by 1.5 for CPS data collected from 1956 to 1966 and by 2.25 for CPS data collected before 1956.

[2]These "a" and "b" parameters are to be used to calculate standard errors of levels only for the March supplement. For the October enrollment data, Spanish origin, use a = 0.001519 and b = $\frac{1}{1856}$. Use formulas (2) and (4) only for these standard error calculations.

[3]This "b" parameter is to be used to calculate the standard error of percentages only. For the October enrollment data use b = 3374.

[4]These factors are to be applied when standard error calculations are made using formulas (1) and (3) only.

college as compared to 13.4 percent of women. The apparent difference between the two estimates is 7.7 percent. The standard error of 21.1 percent as shown above is 0.2. Similarly, the standard error of 13.4 percent is computed to be 0.2 percent. Therefore, using formula (5), the standard error of the estimated difference, 7.7 percent, is about

$$.3 \doteq \sqrt{(.2)^2 + (.2)^2}$$

This means that the 95-percent confidence interval about the difference of 7.7 percent is from 7.1 to 8.3 percent. Therefore, a conclusion that the average estimate derived from all possible samples lies within a range computed in this way would be correct for roughly 95 percent of all possible samples. Since this confidence interval does not contain zero, we may conclude with 95 percent confidence that the percent of men 25 years old and over completing college is greater than the percent of women.

Confidence interval and standard error of a median. The sampling variability of an estimated median depends upon the form of the distribution as well as the size of its base. An approximate method for measuring the reliability of an estimated median is to determine a confidence interval about it. (See the section on sampling variability for a general discussion of confidence intervals.) The following procedure may be used to estimate the 68-percent confidence limits and hence the standard error of a median based on sample data.

1. Determine, using the standard error tables and factors or formula (4), the standard error of the estimate of 50 percent from the distribution;

2. Add to and subtract from 50 percent the standard error determined in step (1);

3. Using the distribution of the characteristics, calculate the values from the distribution corresponding to the two points established in step (2). These values will be the limits for the 68-percent confidence interval.

4. Divide the difference between the two points determined in step (3) by two to obtain the standard error of the median.

A 95-percent confidence interval may be determined by finding the values corresponding to 50 percent plus and minus twice the standard error determined in step (1).

The formula used to implement step (3) is

$$X = \left(\frac{L - A_1}{A_2 - A_1}\right) \times \left(T_2 - T_1\right) + T_1 \qquad (6)$$

where

X = the interpolated estimate of the median's upper or lower limit,

L = the upper or lower limit obtained from step (2),

A_1 and A_2 = the lower and upper values of the cumulative relative frequency for the limits of the interval which contains L,

T_1 and T_2 = the lower and upper values of the interval which contains L.

Illustration of the computation of a confidence interval for a median. Table 9 of this report shows that the median number of school years completed by Floridians 25 years old and over is 12.5.

Table B-6. Factors to be Applied to Standard Errors

Type of characteristic	f_2 factor
U.S. totals	1.0
States:	
California	1.1
Florida	1.1
Georgia	1.1
Illinois	1.1
Indiana	1.0
Massachusetts	0.9
Michigan	1.1
Missouri	1.1
New Jersey	1.0
New York	1.0
North Carolina	1.1
Ohio	1.1
Pennsylvania	1.1
Texas	1.2
Virginia	1.3
Regions:	
Northeast	1.0
Midwest[1]	1.0
South	1.0
West	0.9
SMSA's (except Washington, D.C.)	1.1
Washington, D.C. - MD. - VA	1.0

Note: Apply these factors to standard errors obtained using either tables B-1 through B-4 or the "a" and "b" parameters in table B-5.

[1]Formerly the North Central Region.

1. There was a total of 6,484,000 Floridians 25 years and older. Using formula (4) and tables B-5 and B-6, the standard error of a 50 percent characteristic is found to be approximately 1.0 x 1.1 x .9 = 1.0.

2. To obtain a 68-percent confidence interval on an estimated median, add to and subtract from 50 percent, the standard error found in step 1. This yields percent limits of 49.0 and 51.0.

3. To use formula (6) as described in step 3 of this previous section, the cumulative relative frequency distribution of number of school years completed by Floridians must be calculated from the data in table 9.

   a. Construct a cumulative relative frequency table by number of school years completed as shown in example 1.

   b. Apply formula (6), using the cumulative relative frequency in example 1, to the upper and lower limits, 51.0 and 49.0, calculated in step (2) above. From the example, 31.4 percent of Floridians have completed less than 12 years of high school. Thus, in formula (6), $T_1 = 12$, $T_2 = 13$, $A_1 = 31.4$, $A_2 = 69.1$ and $L = 49.0$.

Example 1. Cumulative Relative Frequency of Number of School Years Completed by Floridians

Number of school years completed	0-12.0	12.1-13.0	13.1 and over
Observed relative frequency	31.4	37.7	30.9
Cumulative relative frequency	31.4	69.1	100.0

Thus, the estimated lower limit of the 68 percent confidence interval for the median would be

$$12.47 = \left(\frac{49.0 - 31.4}{69.1 - 31.4}\right) \times \left(13-12\right) + 12$$

Similarly, the upper limit may be found using formula (6) with $T_1 = 12$, $T_2 = 13$, $A_1 = 31.4$, $A_2 = 69.1$ and $L = 51.0$.

$$12.52 \doteq \left(\frac{51.0 - 31.4}{69.1 - 31.4}\right) \times \left(13-12\right) + 12$$

4. The standard error of the median is, therefore, (12.52 − 12.47)/2, i.e., .03
